Barcode and Labelling software for Windows

## dIndex-2k

- the barcode controlled database for Windows 98/Me/2000/XP

**dIndex:** A powerful label and form printing system which also allows barcode data to be scanned to modify data or generate forms, using databases connected via ODBC – such as MS Access or SQL server.

dIndex also contains two units which interface with a keyboard wedge barcode scanner, and make dIndex the only system you need for running your business.

The barcode driver unit allows your barcode scanner to update the database, adding, copying or printing records, time and date stamping records, or adding subsequent scanned items to a field in a record.

The Point of Sale (PoS unit) enables reports to be generated after scanning multiple barcodes of items to

retrieve records from a second database and extracting prices, tax rates, descriptions, etc.

The Invoice unit can scan two databases, one for customers and one for products, to produce a complete ordering and invoicing/delivery note system.

dIndex includes barcode encoding and printing using EAN, UPC, ITF, Code-39, Code 128, etc. - 50 different types, including Royal Mail and PostNet postal barcode. Code numbers may be fixed, sequential or extracted from the database records. Also prints most common 2D barcode types (PDF417, MaxiCode, Aztec, RSS, etc.)

TestWare version available on our web site [www.dlsoft.com](http://www.dlsoft.com)
